ECE444-PRA2: Flask Web Development + Docker

Overview	1
Goal:	1 2
Flask Web Development	2
Activity 1.1: Installation	3 3
Docker	6
Activity 2.1: Create the PRA2_2 branch and pull the code Activity 2.2: Docker Installation Activity 2.3: Getting things ready locally	6 7
Activity 2.4: Building and running the docker image locally	7

Overview

Goal:

After this recitation, the students should be able to:

- 1. Install Flask and implement an interactive HelloWorld example, and understand the basics of how flask works, templates, web forms and connecting to Databases.
- 2. Download and install Docker.
- 3. Pull and run the updated version of the Flask Activity on their localhost.
- 4. Build and run docker images of the Flask Activity on their localhost.

Material:

 "Flask Web Development: Developing Web Applications with Python" from O'Reilly, <u>available in UofT library and Quercus/Files/Book/Flask (Chapter 1-5)</u>
 (Referred as "textbook" below)

- Tutorial of Docker:
 - i. https://codefresh.io/blog/hello-whale-getting-started-docker-flask/
 - ii. https://docs.docker.com/get-started/
- Docker Image vs Container: Everything You Need to Know (https://stackify.com/docker-image-vs-container-everything-you-need-to-know/)

Plan:

First, students watch the recording of <u>an brief introduction to Flask</u> first, then start to read the book and play with the example.

Next, students watch the <u>recording of introduction to Docker</u>. (Please make sure you access it with your UofT account). TAs will help students with questions during the in-person PRA sessions.

Requirement & Evaluation:

Students should follow the Activities (listed below) and show the completion of the tasks to the TA in their assigned PRA.

Your grade will be determined by the completeness of the task. It is your responsibility to ensure that the TA evaluates your PRA submissions before the conclusion of the PRAsession.

Notes:

- You can use the latest <u>official documentation of flask 3.0.x</u> as another source of reference since our textbook was released in 2014. Also pay attention that the version of Python in the textbook is 2.7/3.3. You are encouraged to use the latest version of Python and Flask on your PC but just remember to take version difference into consideration when you encounter some confusing issues.
- Please pay attention to **notes** in every activity.
- For Windows users, command prompt is recommended (rather than PowerShell).

Flask Web Development

Activity 1.1: Installation

Follow Chapter 1 and install virtual environment and Flask on your local machine.

Notes:

- It writes in the textbook that windows users need to download the installer script to install virtualenv. Actually, with the recent versions of pip, virtualenv can be directly installed using command "python3 -m pip install --user virtualenv". (See here.)
- For some Windows users, simply "pip --install XXX" may not work. Try "python3 -m pip install XXX". (See here.)
- If you are following instructions on Page 4 for Windows, please use the link below to get the ez_setup.py.
 - Link: https://bootstrap.pypa.io/ez_setup.py

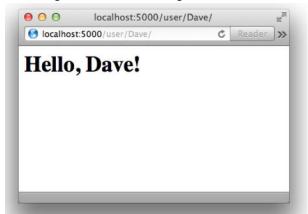

E.g., Activate the virtual environment in the directory created for this PRA nd import flask in this virtual environment.

```
(venv) (base) shuruiz-mbp:flasky shurui$ date
Sat Sep 19 08:37:15 PDT 2020
(venv) (base) shuruiz-mbp:flasky shurui$ python
Python 3.7.6 (default, Jan 8 2020, 13:42:34)
[Clang 4.0.1 (tags/RELEASE_401/final)] :: Anaconda, Inc. on darwin
Type "help", "copyright", "credits" or "license" for more information.
>>> import flask
>>>
```

Activity 1.2: Creating a repo in your own GitHub account and replay the textbook example

The learning goal is to reproduce the example from the textbook. You start with an empty repo, and then commit code from the textbook example to your own repo. The textbook provides all the source code of each example: https://github.com/miguelgrinberg/flasky

- 1. Create an empty public repository, name format: E444-F2024-PRA2
- Create a readme file with your name and mention: this repo is a clone of https://github.com/miguelgrinberg/flasky
 (Because your repo is public on GitHub, and mentioning the source of the code is a good practice of reusing open-source code.)
- 3. Reproduce example 2-1 in your repo, commit the code with meaningful commit message.
- **4.** Reproduce **example 2-2** based on example 2-1 code. **Commit** code changes with meaningful commit message to summarize the change.

5. Push to GitHub

Activity 1.3: Replay and modify example in Chapter 3

Follow Chapter 3 examples and reproduce the screenshot below. That is, you should have at least the 3 elements from top to bottom on your webpage:

- 1. a navigate bar on the top
- 2. "Hello [your name]!" as the title
- 3. a timestamp in 'LLLL' format.

Remember to **commit** the code with reasonable commit messages.

Notes:

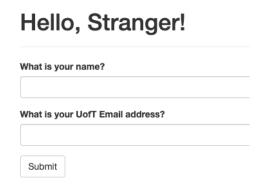

When importing bootstrap, "from flask.ext.bootstrap import Bootstrap" is a
deprecated way. Try this and see the explanation here.

Activity 1.4: Replay and modify example in Chapter 4

- 1. Reproduce example 4-7 in your repo, commit the code with reasonable commit messages.
- 2. Add one more field for filling in email address. Please check if the email address is an UofT account ('utoronto' is a substring of the email address). If the email is an UofT address, after submitting, the browser displays the username and the email address. Otherwise, remind the user to fill in a UofT email (see screenshot below). Commit the code with reasonable commit messages. Run the project.

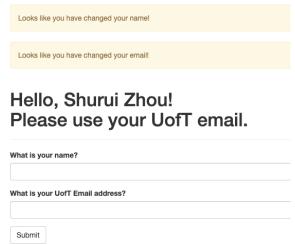

3. Fill in your first name and your UofT email address, click submit

4. Fill in your <u>first name and last name</u> in the <u>1st field</u>, and fill in your <u>first name</u> in the <u>2nd field</u>, click submit. You will receive an error message

5. Fill in your <u>first name and last name</u> in the <u>1st field</u>, and fill in your <u>NON UofT email</u> in the <u>2nd field</u>, click submit. (make a **screenshot**)

Docker

Activity 2.1: Create the PRA2 2 branch and pull the code

For this Activity, reuse the repo you used above.

- Go to the local directory where you cloned the GitHub repo used for PRA2-Flask.
 Make sure the git status is clean, which means all the changes have been added and committed.
- 2. Create a new branch on GitHub named "PRA2_2". Push your local PRA2_2 branch to GitHub. ("git push –u origin PR2 2")
- On GitHub, set the "PRA2 2" as the default branch.

Activity 2.2: Docker Installation

1. Follow the instructions in https://docs.docker.com/get-docker/ to install Docker.

```
Keerthis-MacBook-Pro:~ keerthinelaturu$ docker version
Client:
Cloud integration: 1.0.17
Version:
                   20.10.8
 API version:
                  1.41
 Go version:
                   go1.16.6
 Git commit:
                   3967b7d
 Built:
                   Fri Jul 30 19:55:20 2021
 OS/Arch:
                  darwin/amd64
Context:
                  default
Experimental: true
Server: Docker Engine - Community
Engine:
                   20.10.8
 Version:
 API version: 1.41 (minimum version 1.12)
Go version: gol.16.6
 Git commit:
                 75249d8
                  Fri Jul 30 19:52:10 2021
 Built:
 OS/Arch:
                   linux/amd64
 Experimental:
                   false
 containerd:
                   1.4.9
 Version:
 GitCommit:
                  e25210fe30a0a703442421b0f60afac609f950a3
 runc:
 Version:
                   1.0.1
 GitCommit:
                   v1.0.1-0-g4144b63
 docker-init:
 Version:
                   0.19.0
 GitCommit:
                   de40ad0
```

Activity 2.3: Getting things ready locally

Modify your project for PRA2 Activity 1.4:

- Change "Hello [your name]!" to "Hello [your name]! Welcome to PRA2 Docker!" as the title of your webpage.
- · Commit the changes.

This step is to ensure the code base works well before you dokerize it.

Activity 2.4: Building and running the docker image locally

- 1. Create and add new file "Dockerfile" into the root folder of your repository.
- 2. Create and add new file "requirements.txt" into the root folder of your repository.
- 3. Build and run docker images with the Docker commands.

To show the containers currently running, use **docker ps –a**, you should see the log information indicating the running application.

4. The application will be running on http://localhost:5000.
